

DAY 14 INTERNSHIP REPORT — BASIC SALES SUMMARY & DATA VERIFICATION

Date: 21-09-2026 | Source: Sample Superstore Dataset | Prepared by: Prasanna Shetty

1. Executive Summary

The primary focus of the Day 14 task was calculating baseline key performance indicators (KPIs) from the Sample Superstore dataset and establishing rigorous manual data verification checks. Ensuring absolute mathematical consistency between summary measures and raw transactional records is critical prior to executing deeper exploratory data analysis or dashboard construction.

2. Primary Deliverable: Key Performance Indicators (KPIs)

The sales summary sheet was constructed using live Excel formulas across all 9,994 transactional rows in the dataset. The primary summary metrics derived from the raw data are as follows:

Total Sales	Average Sales	Transaction Count
\$22,97,200.86	\$229.86	9,994

3. Manual Data Verification & Audit Workflow

To validate formula integrity and ensure no hidden filter, truncated range, or floating-point aggregation discrepancy exists, a four-part manual verification protocol was executed:

Verification Check	Result / Value	Status
Micro-Testing (First 10 Sales)	Hand-sum: \$3,085.15 vs. Excel sum: \$3,085.16	MATCH
Mathematical Consistency	Average Sales × Transaction Count ≈ Total Sales	MATCH
Row Count Agreement	COUNT vs. COUNTA vs. ROWS functions = 9,994	MATCH
Status-Bar Inspection	Range R2:R9995 selected directly on Data tab	VERIFIED

4. Technical Audit Conclusions & Next Steps

- **Full Data Coverage:** The transactional count of 9,994 confirms zero missing or uncounted sales rows across the Superstore dataset.
- **Formula Precision:** Micro-testing on initial rows validated that number formatting and rounding operate as expected.
- **Audit Ready:** With verified baseline metrics, downstream exploratory breakdowns (by region, segment, and product category) can proceed with guaranteed numerical integrity.
