Intern Report

HR Attrition Dashboard

WEEK 3 | DAILY JOURNAL ENTRY

LEARNING BY DOING, ONE DAY AT A TIME

1. HR DASHBOARD

2. VALIDATION PAGE

IBM HR Attrition (EMPLOYEE RELATIONS)

1. What is HR attrition?

Answer: Attrition means an employee has left the organization.

The standard IBM HR Analytics dataset uses an Attrition field containing values such as:

- Yes → employee left
- No → employee remained

Your dashboard should therefore answer:

"Where is employee attrition concentrated, and how does it differ across departments, roles and tenure groups?"

Total Employees

The number of employees represented in the current filter context.

Attrition Count

The number of employees whose Attrition = "Yes".

Attrition Rate

The proportion of employees who are classified as having left:

$\text{Attrition Rate} = \frac{\text{Attrition Count}}{\text{Total Employees}}$

2. What is the overall employee attrition situation in the organization?

Answer: The dashboard shows a total workforce of **1,470** employees, of which **237** employees have left, while **1,233** employees remain active. The overall attrition rate is **16.1%**, calculated by dividing the attrition count by the total employee count. These figures were validated on the separate validation page to ensure that the employee totals and attrition calculations were internally consistent. The dashboard therefore provides an overall view of the extent of employee attrition within the dataset.

3. Which department has the highest attrition rate?

Answer: The department analysis shows that **Sales** has the highest attrition rate at **20.6%**, followed by **Human Resources** at **19.0%** and **Research & Development** at **13.8%**. This comparison is useful because the attrition rate considers the size of each department rather than relying only on the number of employees who left. The dashboard therefore indicates that attrition is relatively more concentrated in the Sales department than in the other departments represented in the dataset.

4. Which job roles show the highest attrition rates?

Answer: The job-role analysis indicates that **Sales Representatives** have the highest attrition rate at **39.8%**. This is followed by **Laboratory Technicians** at **23.9%** and **Human Resources** roles at **23.1%**, while roles such as Research Director and Manager show considerably lower rates. This visualization helped identify that attrition is not distributed evenly across job roles. The result highlights the importance of analyzing role-level attrition rather than relying only on department-level comparisons.

5. How does attrition vary according to employee tenure?

Answer: The tenure analysis shows a clear difference between the tenure groups displayed in the dashboard. Employees with **0–2 years of service** have the highest attrition rate at **29.8%**, followed by **3–5 years** at **13.8%**, **6–10 years** at **12.3%**, and **11+ years** at **8.1%**. The results show that the highest observed attrition rate occurs among employees in the earliest tenure group, while the rate decreases across the longer-tenure groups in this dataset. This makes tenure an important segment for management-level attrition analysis.

6. Why is attrition rate more useful than attrition count for management analysis?

Answer: The dashboard demonstrates why **attrition rate is more meaningful than attrition count alone** when comparing different employee groups. A raw count can be higher simply because a department or role has more employees, whereas the attrition rate shows the proportion of employees leaving relative to the size of the group. By combining total employees, attrition count, active employees, and attrition rate in the dashboard, management can examine both the scale and relative level of attrition. This approach provides a more balanced basis for comparing departments, job roles, and tenure groups.
